

Enterography Exams can be a 'Breeze'

Imaging supervisors share how Breeza® flavored beverage for neutral abdominal/pelvic imaging improved their department's workflow and patient satisfaction

Taste and Texture Create a World of Difference

MRI Technologist, Corpus Christi, TX

"We average 2 patients a month. Every single time, I used to dread MRE because it was so hard to get the patients to drink.

Since we started using Breeza flavored beverage for neutral abdominal/pelvic imaging, it is a 'breeze' to get the patients to drink. We also don't have to worry about the patient having to get up to use the bathroom mid-exam anymore because it is much easier on their tummies. It's made a world of difference with patient compliance, decreasing our time prepping and exam time. In fact, we're able to schedule more enterography studies now."

MRI Supervisor, Burlington, VT

"Our patients are much more successful drinking Breeza as their oral contrast agent. They complete our drinking protocol and I hear a lot about how easy the flavor is on the palate. Patients compare it to an uncarbonated Sierra Mist® soda, and our satisfaction score has risen because of it. We do not have to remind patients to keep drinking because the flavor and consistency is not like the chalky thick contrast we used to have. Our department is able to stay on schedule."

Radiology Manager, Nashua, NH

"Breeza has made a big difference when it comes to patients following the drinking protocol. Patients regularly tell us how easy it is to drink compared to our previous oral contrast. Now, scheduling patients for enterography studies is easier and we've experienced less cancellations."

Executive Director, Clive, IA

"The better taste and texture of Breeza® has made all the difference. Though patients have a lot to drink, we keep our Breeza chilled (not too cold) and they tolerate it well. We no longer coerce the patients into drinking, causing longer exam time lengths. They are typically compliant and are surprised at how good Breeza tastes."

Better Compliance, Easier Workflow, and Reduced Time-to-Scan

MRI Technologist, Baltimore, MD

"We see 15 to 20 patients a month for enterography studies and they prefer the taste of Breeza flavored beverage for neutral abdominal/pelvic imaging over our previous contrast agent. Children drink it better and hold it down thanks to the lemon-lime flavor. With patients completing the drinking protocol, we can provide a better diagnosis.

Our staff can focus on other tasks at hand instead of coaching and cleaning up from the patient getting sick. Knowing we are giving something more palatable to our patients eliminates the risk of falling behind with our exams."

MRI Supervisor, Sacramento, CA

Our facility performs 40 to 50 enterography exams per month and Breeza is especially helpful with pediatric patients. We were able to decrease preparation time from 2 hours to 1 hour and reduce the time patients spend in the waiting room. We have a higher retention rate, just as promised, and patients love the taste and texture."

Lead CT Technologist, Flowood, MS

We used to use a barium suspension as our oral contrast for roughly 25 enterography patients per month. However, about two-thirds of my patients either could not finish the contrast or threw up.

I have been using Breeza for 3 years and less than 10 patients have experienced the same symptoms. They like the taste which makes it much easier to finish the contrast for a good diagnostic study. I can't say enough good things about Breeza! I would recommend it to anyone. Using Breeza has taken the stress out of doing an Enterography CT."

Imaging Manager, Chicago, IL

Breeza is much more palatable than the prior oral contrast that was being used, especially for pediatric patients. Using Breeza has increased the tolerance for most patients with a higher rate of ingesting all the contrast necessary for a quality study. Patients drink faster and on time, increasing our ability to maintain a busy schedule."

Clinical Manager, Cleveland, OH

Our facility sees between 45 and 65 patients for enterography studies in a month and they never complain about the taste of Breeza. In fact, patients are pleasantly surprised by the taste! There are no delays due to the taste of the contrast and because they're able to complete the drinking protocol, the techs don't need to spend time coaching patients. The patients start drinking and are scanned without delays."
